Welcome to The Richland Hospital, Inc.

Congratulations & Thank You

The birth of your baby is one of the most memorable, life-changing, exciting experiences of your life. The Richland Hospital is honored to be a part of that experience. During this time of your pregnancy and birth, we want to provide you and your family with a sense of safety, support and compassion.

To prepare for this day we are providing you with information on registration, information regarding birth classes, visiting hours, infant security, pain management, our rooming in policy, and breastfeeding. Please use this information to help educate yourself on the choices available to you.

What to bring for you and baby

You’ve been preparing for your baby’s birth for nine months, but the first contractions may still come as a surprise. To reduce your list of things to worry about once labor begins, pack for your stay with us at the Richland Hospital.

The following checklist includes items you may want to consider packing:

- A comfortable nightgown or nightshirt.
- Warm socks or slippers with nonskid bottoms, in case your feet get cold or you want to walk around.
- Loose, comfortable clothes for you to wear while nursing, or on your trip home.
- Toiletries such as lip balm, shampoo, conditioner etc.
- A list of phone numbers of people you want to call. Cell phones are allowed in the OB Department and our Birthing Suites.
- A hair tie (if you have long hair).
- Snacks for your coach or partner, so they won’t have to leave you (When your labor is intense, meals will be provided for your partner).
- Camera.
- Games or puzzles to help you keep your mind off labor.
- A comfortable pillow.
- Focal point.
- Change of clothes for your support person.
- Change for vending machines.
- Nursing bra (if breastfeeding) and panties.
- Car seat.
- Blanket for baby.
- Going-home outfit for baby.
- Baby Book (We’ll be happy to put your baby’s footprints right in your book).
- DVDs – all of our Birthing Suites have DVD players for your entertainment.
This information is being provided to help you understand and determine the difference between the signs and symptoms of true labor, preterm labor, and pre-labor, and to address conditions that require immediate medical attention.

**Signs and Symptoms that require IMMEDIATE MEDICAL ATTENTION**

- Bag of water breaks (even if contractions are not present). A gush of fluid or a steady trickle, which you cannot control, are both signs that your water has broken. Fluid may be clear, yellowish, green or pink tinged.
- Constant, severe abdominal pain.
- Bright red vaginal bleeding.
- Constant rectal pressure.
- Continued or severe headache, blurring of vision or spots before your eyes.
- Chill / fever.
- Fainting spell or loss of consciousness.
- Severe or continued nausea and or vomiting.
- Decreased baby movement or kick-counts.

**Signs and Symptoms of True Labor**

- Contractions occur at regular times.
  - With your first baby, when contractions are 5 minutes apart or closer for 1 hour.
  - If this is not your first baby, when contractions are 6-8 minutes apart for 1 hour.
  Timing contractions: time in minutes from the beginning of one contraction to the beginning of the next contraction.
- Time between contractions becomes shorter.
- Discomfort Increases; difficulty walking / talking through contractions.
- Contractions are stronger when walking and do not subside when resting.
- Bloody (show) discharge.
- Rectal pressure, feeling as if you need to have a bowel movement.
Signs and Symptoms of Pre-term Labor

Pre-term labor is labor that begins more than 3 weeks before your due date.

- Menstrual-like cramps, stomach feels like it is “balling up.”
- Pelvic Pressure.
- Low Backache.
- A new vaginal discharge or any increase in vaginal discharge especially red or pink.

Signs and Symptoms of Pre-Labor

Pain / cramps every 10 minutes or less that do not subside with rest, drinking fluids, or after emptying your bladder.

Pre-labor may or may not go into true labor and may happen several times before true labor starts and last several days.

- Contractions may be regular or irregular (come and go) but do not get stronger.
- Contractions subside or are less frequent when resting.
- Time between contractions remains the same or contractions become further apart.
- No cervical change when examined by a physician or nurse.

How to do Kick-Counts

1. Lie down on your side or sit in a comfortable chair. Pay attention to the movement of your baby.
2. Counting every kick or movement until your baby has moved 8 times.
3. If your baby does not move 8 times in 2 hours, drink or eat something and count for another 2 hours.
4. If your baby has not moved 8 times in the next 2 hours you should contact the Birth Center or your physician.
Most women experience some pain during labor and delivery. We as a staff are dedicated to provide hands-on-labor support and to provide the experience you want whether it is “natural”, pharmacological, or a combination. Every woman is different and has her own individualized needs during labor. This information is provided to help you make educated choices and to help provide you with a fulfilling birth experience.

**Relaxation / Breathing Methods**

- Relaxation keeps you from getting too tired to work with the labor and makes labor less painful.
- Breathing techniques facilitate the relaxation response and provide a means of attention focusing in order to decrease pain and anxiety.
- Relaxation/breathing methods are known for their rhythmic breathing technique, which help women turn their attention away from their contractions. This method encourages laboring women to direct their attention to a focal point – something you will look at, listen to or feel.

**Music Therapy**

Soft music decreases both sensation and distress of active labor pain especially during early labor. We have CD players in each room and several CD’s available and you may bring your own favorites.

**Aromatherapy**

Therapeutic use of essential oils can promote physical and psychological well being. We have it available for use in an electric vaporizer.

**Water Therapy**

This can be extremely effective for relaxing and reducing pain. A woman can feel almost weightless when submersed in water. This reduces pressure on joints and relieves muscle tension. The whirlpool can offer a gravity advantage to bring the baby into the birth canal as well as offering relaxation and relief of back pain. There is a whirlpool tub in each labor room.
Massage

Massage has been shown to promote labor progress, decrease pain perception and increase ability to cope with labor. This can be done with hands or different types of massagers which are available.

Positioning

During labor, positioning can increase the size of the pelvic cavity (birth canal) to help speed up labor. Sitting or standing in an upright position allows gravity to assist with speeding up the labor process. Lying on your side allows relaxation. A knee to chest position can help to open the pelvic cavity and assists with pushing.

Birth Ball

Also known as a Swiss or exercise ball, this may be used to relieve a backache by leaning forward on a support. It can also be used for pelvic rocking.

Simply getting up and walking helps to relieve a backache and encourages the baby to descend into the pelvic cavity to speed up labor.
Relaxing, Breathing & Positioning

- Standing
- Standing, leaning forward
- Slow dancing
- The lunge (standing)
- The lunge (kneeling)
- Sitting upright
- Sitting on commode
- Semi sitting
- Sitting leaning forward with support
- Hands and knees
- Kneeling over chair seat
- Kneeling leaning on head of bed
- Kneeling over birth ball
- Side lying
- Squatting
- Supported squat
- The dangle
**IV Medication**

IV medications are given after you have IV access with a needle placed in your hand or arm by the labor nurse. They cannot be given when you are close to delivery because of the chance of the baby having respiratory depression and being less alert after birth.

<table>
<thead>
<tr>
<th>IV Medications</th>
<th>Description of Medication</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Stadol</strong></td>
<td>Can help to manage moderate to severe pain during labor. It can be given every three to four hours.</td>
<td><strong>For Mom</strong></td>
<td>• Increases pain tolerance, takes the “edge off.”&lt;br&gt;• Increase the ability to relax.</td>
</tr>
<tr>
<td><strong>Fentanyl</strong></td>
<td>This is a short-acting medication and helps to relax the mother. It can be given every one to two hours as needed.</td>
<td><strong>For Mom</strong></td>
<td>• Usually fast-acting.&lt;br&gt;• Effective pain relief in early labor.</td>
</tr>
<tr>
<td><strong>Nubain</strong></td>
<td>Another short-acting medication that is fast acting and can be given every one to two hours.</td>
<td><strong>For Mom</strong></td>
<td>• Usually fast-acting.&lt;br&gt;• Effective pain relief in early labor.</td>
</tr>
</tbody>

Spinal Anesthesia
Preparations for either an intrathecal or an epidural block include a bolus of IV fluids and signing a consent form after the anesthetist explains the procedure and the risks.

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intrathecal</td>
<td>Given by an anesthetist through an injection in the lower back. A spinal narcotic can give immediate relief. This is sometimes used when a mother is close to delivery but is exhausted and needs some rest before pushing. This will usually last for one to two hours.</td>
<td>For Mom • Allows mobility during labor and after labor. • Immediate pain control. • Increases ability to relax, resulting in possible decrease in length of labor. • Allows patient to participate in labor with effective pushing.</td>
<td>For Mom • Side effects may include nausea, vomiting, itching, brief drop in blood pressure, urinary retention, and / or headache. • Pain relief may not meet mother’s expectations. <strong>Little or no effect to baby</strong></td>
</tr>
<tr>
<td>Epidural</td>
<td>Given by an anesthetist after active labor has been established. It is injected through a small flexible catheter placed in your lower back that provides pain relief in the lower abdomen, legs and birth canal. Catheter is inserted, a small test dose is injected and relief follows shortly.</td>
<td>For Mom • Can be given in the active phase of labor. • Provides pain relief with no sedation. • Can lengthen or shorten length of labor. • Increases the ability to relax. <strong>Little or no effect to baby</strong></td>
<td>For Mom • Side effects may include nausea, vomiting, itching and / or decrease in blood pressure, decreased ability to push, which leads to higher incidences of vacuum assisted deliveries, confinment to bed and possible headache. • A catheter will be placed in the bladder, because you will not feel the urge to urinate.</td>
</tr>
</tbody>
</table>

Other Anesthesia

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pudendal Block</td>
<td>Performed by your doctor, the pudendal block provides pain relief to the lower abdomen, legs and birth canal. This procedure blocks the pudendal nerve, which supplies sensation to the lower portion of the vagina and the skin around the opening of the vagina and rectum.</td>
<td>For Mom • Very effective during delivery process in providing anesthesia for perineal area. • Also provides anesthesia for episiotomy if needed.</td>
<td>For Mom • Some disadvantages might be numbness of legs and the fact that there is no relief of uterine contraction pain.</td>
</tr>
<tr>
<td>Local Anesthesia</td>
<td>Given by your doctor, this provides local numbing for the repair of laceration after delivery.</td>
<td>For Mom • No sensation of repair during suturing process.</td>
<td></td>
</tr>

Feeding your child is one of the most important choices you will make. We know from many years of research how important breastfeeding is to the normal health of a mother and her newborn.

**Breastfeeding Makes a Difference**

- Breast milk helps infants fight infections and develop healthy immune systems.
- Breastfeeding helps develop strong mother-child relationships.
- Mothers who choose to breastfeed are healthier, with less risk of breast cancer and ovarian cancer.
- Breastfeeding families save money on formula and healthcare costs.
- Employers and communities benefit from healthier infants and children, and less parent absenteeism from work.
- Breastfeeding contributes to a better environment by using less energy and creating less waste.

Breastfeeding is a learned skill. Years ago women grew up learning about breastfeeding from the nursing mothers and babies around them. Today, a mother may have grown up without ever having seen a baby breastfed. What a mother knows is only part of the picture. The baby, too, affects how breastfeeding goes. Some babies take to breastfeeding easily and others need time, practice, and encouragement to do well.

Breastfeeding can be challenging during the early weeks. Our goal is to provide each mother with education and support. Breastfeeding almost always gets easier with practice and our staff is available 24 hours a day and 7 days a week to help you make your experience a positive one.
For those visiting the Joan Woodman Orton McCollum Birth Center

Our goal is to provide the new mother with a special time to bond with her newborn and to provide her an environment that will promote rest and recuperation.

Please inform your family and friends of the following visitor’s guidelines.

**Labor & Delivery:**
- Labor support persons should be kept to a reasonable number (3).
- Visitors remaining with the patient during the night will be asked to wear name tags.
- Visitors may be asked to leave the room during procedures.
- To improve security elevators and stairwells will be locked at designated times.
- Only children that are siblings of the newborn will be allowed to visit during labor or be present during the birth.
- Children attending the birth must be accompanied by an adult other than the mother’s support person.
- Following the birth the baby will be placed skin to skin with mother and will remain there for at least 60 minutes.
- No visitors (except the significant other) will be admitted to the room for the first 90 minutes after the birth of the baby.
- Following a cesarean birth the mother, baby and significant other will be taken to the patient’s room for recovery. No visitors will be admitted for the first 2-3 hours after the delivery.

**Postpartum:**
- All visitors will be asked to wash their hands prior to holding the new baby and to cover soiled clothing. If visitors are ill they will not be allowed to visit.
- Visiting hours are from 9am until 9pm.
- There will be a designated quiet time between the hours of 1 and 3pm. This 2 hour time period encourages peaceful rest in a quiet environment for mom and baby. We strongly encourage you to take advantage of this restful environment and let your visitors know to plan their visits around this mom and baby nap time.
- Visitors will not be allowed to visit during the nighttime hours unless there are special circumstances.
